Mucoadhesive polymer-based drug delivery systems were first utilized by Nagai and collaborators as carriers for local treatment to the buccal cavity (44, 45). Mucus is also present in the nasal and gastrointestinal cavity, the vagina, and other hollow organs, providing a diverse arena for the application of mucoadhesive

Conventional drug delivery systems are known to provide an immediate release of drug, in which one can not control the release of the drug and can not maintain effective concentration at the target site for longer time. Controlled drug delivery

systems offer spatial control over the drug release. Osmotic pumps are most promising systems for controlled drug delivery.
